IT Providers [1]

InGeoCloudS offers a cloud-based software stack for managing geo-spatial data and services according to the Platform-as-a-Service paradigm. InGeoCloudS defines an environment specifically tailored for geo-spatial applications providing built-in elastic database service, elastic file system service, elastic map service, elastic geo computation, elastic linked open data, and elastic web service. IT Providers can ask for their own instance of InGeoCloudS platform to independently deploy their own services.

Currently, the consortium still includes the possibility to define offers around software and documentation open source packages for answering these needs. Depending on the nature of scope of these offer(s), various documentation sets shall be designed. This might likely include:

- Release Notes
- Licences
- Installation and configuration Manuals
